Poplar Farms a fertilizer dealer in Manitowoc conducted a corn study comparing several different bio stimulant products. All products were mixed with 8 gallons of pop up starter. The average test plot moisture of the corn was 25%. The average test weight of the corn plots was 50lbs. The results are listed below and were statistically significant in demonstrating the design of the product to increase the overall quality of the plant therefore increasing the plant's yield potential.

## Yield – Bushels/Acre
